

Firestore

Google Firestore is a ripe target for getting easy wins. Just append `/.json`` to the URL and dumps the entire database,

This occurs when the security rules of the database are left on ``true`` for both of the values, more like left in ``test mode`` for easy access.

From the developer's Firestore console the security rules will look something like this:

```
{  
  ".read": true,  
  ".write": true  
}
```

An attacker or a malicious user can have ``read & write`` control over the database.

We can find ``databaseURL`` in the source code of the webpage.

So, we can find the flag(view all data here) by visiting this URL :-

<https://mdctf-45ff5-default-rtdb.firebaseio.com/.json>
